

Job Description, Radiology Technologist

Radiologic technologists, more commonly known as radiology technicians, perform X-rays requested by physicians to help diagnose a variety of medical issues. Radiology technicians must be able to closely follow physician instructions, prepare radiograph equipment, position patients correctly and accurately capture the requested diagnostic images. Radiologic technologists must also protect the patient's safety during the X-ray procedure. Radiology tech jobs require individuals to manipulate heavy equipment and maneuver patients who may be disabled, so it is ideal for such technicians to be in good physical condition. Radiologic technologists are potentially exposed to radiation on a daily basis and must take the proper precautions to protect themselves. Radiology technicians work mostly in hospitals; however, some maintain employment in private physicians' practices and imaging centers.
